3.0 Progress	3
4.0 Planned Work	4

1.0 BACKGROUND

The Bottom Ash Ponds (BAPs) at the Mountaineer Plant is regulated by the Federal CCR Rule, 40 CFR Part 257. Sampling and analyses of groundwater from the monitoring network installed pursuant to 40 CFR §257.95 identified the following Appendix IV constituent at statistically significant levels above the respective groundwater protection standards (GWPS): lithium.

AEP determined that there are three technically feasible alternatives for remediating the groundwater at the BAP. Each alternative includes some form of source control. The current plan for source control would be to close the bottom ash pond by removing the ash. All three (3) Alternatives are currently under evaluation.

Alternative #1: Source Control with Monitored Natural Attenuation

Alternative #2: Source Control with Groundwater Plume Containment by Hydraulic Containment System

Alternative #3: Source Control and In-Situ Treatment by Permeable Reactive Barrier

The Assessment of Corrective Measures (ACM) report was prepared and posted to the Operating Record on June 24, 2019. A public meeting was conducted on August 22, 2019 in the town of New Haven, West Virginia to discuss the remediation technologies that are technically feasible for the specific site conditions at the bottom ash pond. A 30-day public comment period started on August 22 and ended on September 21, 2019. No public comments were received during the 30-day period.

2.0 PURPOSE

This semiannual report is required by 40 CCR §257.97 and describes AEP's progress in selecting and designing the corrective measure(s) discussed in the ACM Report.

This report covers the period from: September 21, 2020 – March 20, 2021.

3.0 PROGRESS

During the period covered by Report-03, AEP has made progress in evaluating each of the three corrective measure alternatives.

AEP has been working with an engineering firm. The detailed engineering is continuing for design work for closure by removal and other ancillary modifications to the BAPs. This work includes alternate CCR disposal methods and water treatment methods to align the facility with finalized CCR and proposed ELG rules.

In regards to Alternatives 2 and 3, the laboratory testing of potential media to remove constituents of concern complete awaiting final report.

AEP conducted the semi-annual groundwater sampling and testing during this report period. The results are summarized in the report, "Annual Groundwater Monitoring and Corrective Action Report."

AEP has retained the services of a consultant to further evaluate the technologies identified in the ACM as per the criteria set forth in 40 CCR §257.97.

4.0 PLANNED WORK

In terms of planned work, AEP will continue to evaluate each of the three corrective measure alternatives.

AEP will continue to work on the design and plan for closure by removal project as means of source control for each alternative.

AEP will finalize media evaluation. This work is being conducted under a contract with the Electric Power Research Institute (EPRI).

AEP will sample and test all of the monitoring wells as part of the semi-annual requirement.

AEP also plans to continue work with consultant to further evaluate the technologies identified in the ACM as per the criteria set forth in 40 CCR §257.97 regarding selection and design of a remedy.

AEP will submit another progress report by September 20, 2021.
